YOUSEF ALSAGHEER

JUNIOR SOFTWARE DEVELOPER

CAREER SUMMARY

Computer Science & AI graduate (Sohag University, July 2026, 85%) seeking a junior software developer role. Produced a full-stack wedding-services booking platform (ASP.NET Core, SQL Server, React) and wrote its complete analysis and design documentation. Good at understanding what people want and turning it into a working result; looking to grow under experienced engineers.

EXPERTISE

- C# / .NET 8
- ASP.NET Core Web API
- SQL Server & T-SQL
- React
- REST APIs & JWT auth
- Git & GitHub
- Python, Java, C++
- System analysis (DFD, UML, ERD)
- Technical documentation
- Visual Studio, SSMS, PyCharm

EDUCATION

B.Sc. Computer Science & AI
Sohag University, Faculty of Computers & Artificial Intelligence
2022 – July 2026 · Grade 85%

American High School Diploma
English-medium education; British school through grade 8

LANGUAGES

Arabic — native
English — fluent

LEARNING NOW

Python full-stack development: FastAPI, SQLite, HTML/CSS/JavaScript

PROJECTS

FARAHI — WEDDING SERVICES BOOKING PLATFORM

Graduation project, Sohag University || 2025 – 2026 || ASP.NET Core 8 · SQL Server · React 18 + Vite · xUnit

Our graduation project, taken from requirements and design through running and testing the finished app: a marketplace where couples browse and book wedding halls and services, providers manage listings and bookings, and admins approve services.

- Stack: ASP.NET Core 8 Web API (JWT auth, role-based access, 40+ endpoints), SQL Server (17 tables, migration scripts), React + Vite frontend, xUnit integration tests.
- Authored the full 33-page project documentation: problem definition and requirements, Waterfall SDLC, context diagram, level-1 DFD, use-case diagram with nine use-case scenarios, ERD, and the UI/UX chapter covering every screen.
- Main point of contact with our three supervisors: discussed ideas and requirements with them, turned their feedback into the design document, and delivered what they asked for at the final review.
- On the build: defined the requirements and screens, used an AI coding assistant to generate the code, reviewed it, ran the API, database and frontend locally, tested the booking flow and fixed what broke.
- What I learned: how a .NET API, a SQL database and a React frontend fit together; reading and tracing C# code; working with Swagger, SSMS and SQL migrations.

RELEVANT COURSEWORK

Object-Oriented Programming (C++, C#, Java) · Database Systems (SQL) · Python & NumPy · Mobile Application Development · Software Engineering · Artificial Intelligence and Machine Learning fundamentals

ACADEMIC PROJECTS

Image recognition exercises — Python, NumPy: loaded images as pixel arrays to detect stop signs and classify their colour, and ran basic face detection on photos. Pattern-recognition coursework covering feature extraction and simple classifiers.
